

ABSTRACT

A remote control toy system that is advantageous in size reduction of models and that can implement colorful plays is provided.

5 A remote control toy system includes a plurality of sets. Each set includes a controller, and a model controlled in action on the basis of data transmitted from the controller so as to correspond to an operation situation of a user. An accessory device is provided as a device independent from the controllers
10 and models. The accessory device is capable of conducting data communication with the controllers and models. Each of the controllers, the models, and the accessory device includes a radio communication module serving as a device for executing the data communication and capable of conducting bilateral data
15 communication based on the Bluetooth standards, and a control device for implementing various controls based on data communication conducted via the radio communication module.
